# Why so much fuss about DIP??

- Improve pictorial information for human interpretation.
- Processing of image data for tasks(storage, transmission and extraction).

# What is DIP?

But what is an Image??

- Two dimensional function  $f(x,y)$
  - $x,y$  plane /spatial coordinates
  - Value/Amplitude of  $f$  @  $x,y$  is the intensity or gray level of that image at those points.
  - Digital image-  $x,y$  and intensity values of  $f$  are finite and discrete values.
  - DI has a finite number of elements ,each has a particular value and location – **picture elements ,image elements ,pel** and **pixels**(the most widely used term)
  - Processing digital images by means of a digital computer.
-

- Human perception-Vision sense.
- Only a part of the electromagnetic spectrum is visible for humans.
- Imaging machines – gamma to radio waves -- Entire EM spectrum(almost).
- Confusion with other related areas– image analysis, computer vision.
  - No general agreement on this ☹
- One way, but its limits the applications- both input and output of a process are images.

# Three Types of computerized processes

High

- “making” sense –image analysis, performing cognitive functions normally associated with human vision.

Mid

- Tasks like segmentation, reduce features to a suitable form for computer processing, recognition of objects.
- Input are images, but output are attributes extracted from these images

Low

- Primitive operations-image preprocessing. Reduce noise, contrast enhancement and image sharpening.
- Input and output are images.

# Verticals in DIP

- Image sharpening and restoration
- Medical Field
  - Gamma-ray imaging
  - PET scan
  - X-Ray Imaging
  - Medical CT scan
  - UV imaging
- Robot vision
- Pattern recognition
- Filters on Editing Apps and Social Media

# Medical field

# Robot Vision

# Pattern

(a)

(b)

# Social Media

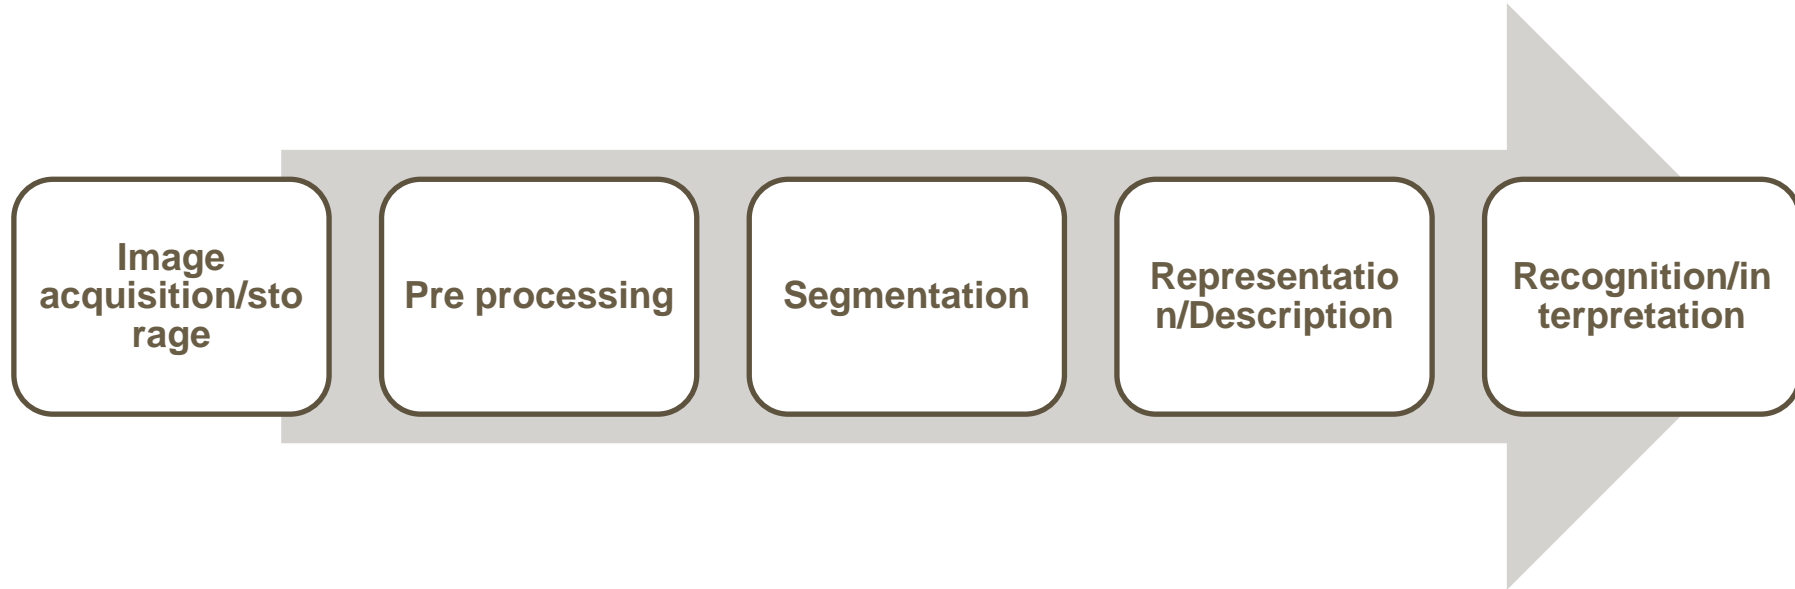

Original Image

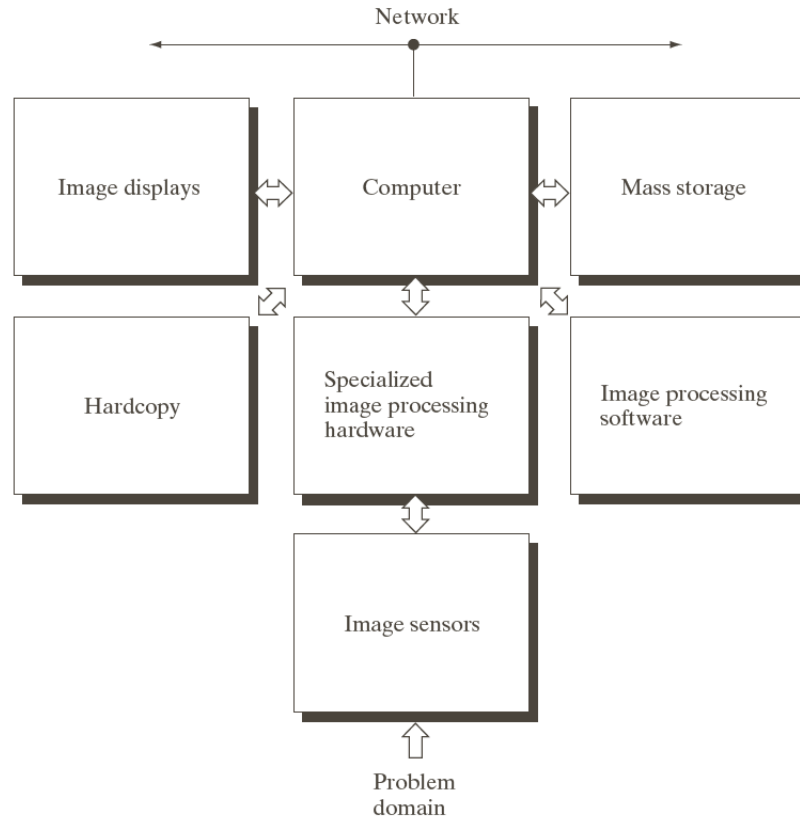

Filtered Image

# Steps in Digital Image Processing

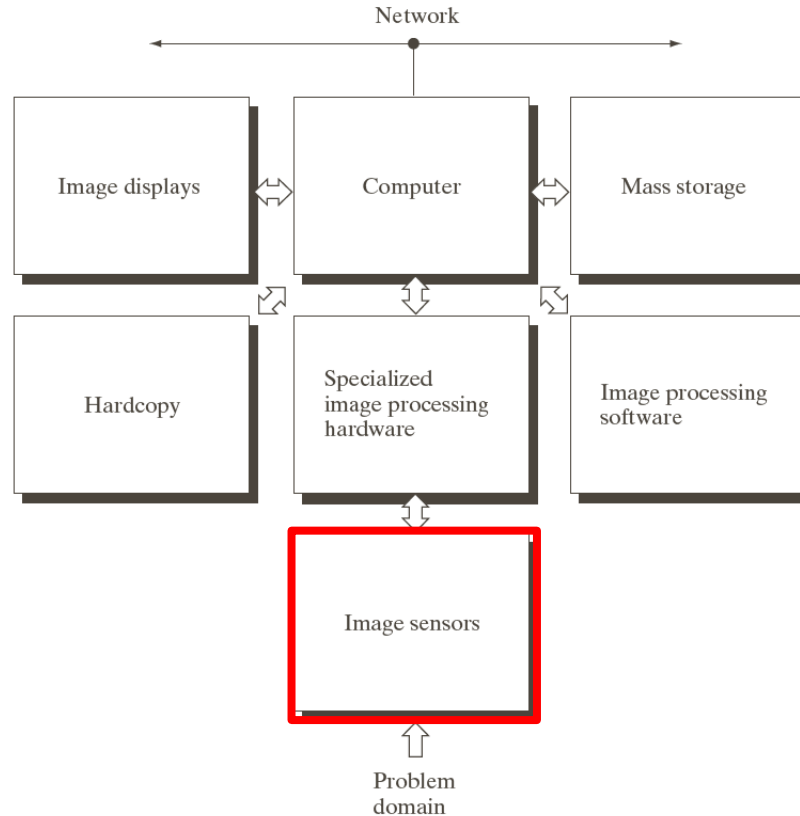

- Acquisition and storage
- Load into memory and save to disk
- Manipulation, enhancement, and restoration
- Segmentation
- Information extraction/representation

# Image Sensing & Acquisition

- Generation of images-combination of “illumination” source and the absorption of energy by source by the elements of “scene” .
- Illumination source – Source of EM energy- Radar, infrared, X-Ray, Ultrasound.
- Scene –objects ,buried rock, human brain.
- Reflection – From objects
- Transmission- Through objects.

# Sensor

Transform the incident energy into digital images.

- Incoming energy converted into voltage using input electrical power and sensor material.
  - Sensor material- depend on type of energy being detected.
  - Voltage- output of sensor.
  - Digitize the response to obtain the digital quantity.
-

THANK  
YOU

A graphic featuring the words "THANK YOU" in a stylized, neon-like font. The word "THANK" is rendered in a pinkish-purple color, and "YOU" is in a light blue color. The text is centered and surrounded by several horizontal lines of varying lengths and colors, including pink, yellow, and light blue, creating a dynamic, glowing effect against a dark background.
